

The goal of this design is to keep the system simple and easy to use while still providing useful information to teachers. Students take math assessments through a web application, and their answers are analyzed to determine whether they are on grade level or below grade level in specific math skills. Teachers can then view this information in a dashboard to understand where each student is struggling and decide what topics to focus on during teaching. A key tradeoff in this design is using basic rules and scoring logic instead of more advanced machine learning models. While this limits how detailed the analysis can be, it makes the system easier to build, easier to understand, and more appropriate for a classroom focused prototype.
